BridgeFlow: Feedback and Build Plan

Oct 31, 2026 · @qila

Overview

BridgeFlow answers both Startup ASEAN problem statements in one product: founders do the work, and organizers see proof that connections became outcomes. The role switcher is the right hackathon choice, because judges experience both sides in seconds.

What is already strong:

- **A clear loop:** the founder acts, the organizer verifies, and the AI keeps opportunities moving.
- **A familiar pattern:** an Asana-style board needs no explanation.
- **The organizer view is the differentiator:** most ecosystem tools stop at "intro made"; BridgeFlow shows what happened next.

What to sharpen

Four changes move BridgeFlow from a generic task list to a convincing outcome-conversion tool.

1. **Make the AI do more than suggest tasks.** The agent should read context (notes, a pasted email, a deck) and classify opportunity type, market and stage. It should explain why an opportunity is stalled (for example, no activity in 12 days and demo date unconfirmed). It should draft the follow-up itself, such as a Bahasa Indonesia message with an English version beside it, and suggest the next stage with the evidence that would prove it.
2. **Define funnel stages per outcome type.**
   - Investment: Intro, Meeting, Data room, Term sheet, Closed
   - Partnership: Intro, Discovery, Follow-up, Pilot, Contract
   - Expansion: Interest, Local partner, Launch
   - POC: Brief, Scoped, Running, Evaluated
3. **Make outcome verification two-sided.** A founder reports "pilot started", and the organizer (or the counterparty) confirms it with evidence. Only verified outcomes count on the dashboard. This separates BridgeFlow from vanity metrics.
4. **Add a stalled signal.** An opportunity with no update for a set number of days, or an overdue task, gets flagged. The organizer dashboard lists stalled opportunities with an AI-suggested nudge.

Where Gemma 4 fits

Every AI feature in BridgeFlow maps to a documented Gemma 4 capability, which meets the hackathon requirement and gives judges a clear reason for each model call.

Feature	Gemma 4 capability
Parse a pasted email, notes or screenshot into an opportunity	Multimodal input, OCR, structured output
Generate action plan and tasks	Thinking mode plus structured JSON output
Draft follow-up in the counterparty's language	Trained on 140+ languages
Update stage, create tasks, flag stalled items	Function calling
Organizer insight summary, such as "Indonesia partnerships stall at the pilot stage"	Reasoning over pipeline data

Use a small model (E2B or E4B) for quick classification and drafts, and a larger one (26B or 31B) for plan generation and organizer insights. Say this in the pitch: it shows a deliberate model choice per task.

The five screens

Three screens serve the Founder role and two serve the ASEAN Organizer role, switched with a simple role toggle instead of authentication.

#	Screen	Role	What it shows
1	Opportunity Board	Founder	Kanban columns by stage. Cards show counterparty, type, market, next task and a health badge (on track, at risk, stalled). A "New opportunity" button.
2	Opportunity Details + AI	Founder	Timeline, notes, counterparty and files on the left. AI panel on the right: Generate action plan, one-click suggested tasks, and Draft follow-up with a language toggle.
3	My Tasks	Founder	Cross-opportunity task list grouped by due date. Completing a task updates the opportunity's health. Includes a Report outcome action.

#	Screen	Role	What it shows
4	Impact Dashboard	Organizer	Conversion funnel, outcomes by type, cross-border corridors (for example SG to ID), a stalled opportunities list and an AI insight box.
5	Outcome Verification	Organizer	Queue of founder-reported outcomes with evidence. Verify, Request info or Reject. Verified outcomes update the dashboard live.

Example AI output on screen 2:

- **Opportunity type:** Commercial partnership
- **Target market:** Indonesia
- **Current stage:** Follow-up
- **Suggested tasks:** prepare product demonstration; confirm demo date with distributor; draft a 3-month pilot proposal; schedule partnership follow-up

Demo flow

A three-minute walkthrough shows the full loop from founder action to verified ecosystem impact.

1. As **Founder**, paste a rough note from a distributor chat. The AI creates the opportunity: Commercial partnership, Indonesia, Follow-up.
2. Click **Generate action plan**. Show the suggested tasks and a drafted Bahasa Indonesia message.
3. Complete a task, then **report an outcome**, for example "Pilot agreed."
4. Switch role to **Organizer**. The dashboard shows a new pending outcome.
5. **Verify** it. The funnel and cross-border counts update live.
6. Show the stalled opportunities list and the AI insight.

Hackathon scope

Build a polished, believable demo rather than a broad product.

Build:

- Seeded realistic data: 15 to 25 opportunities across 5 or more ASEAN countries
- Real Gemma 4 calls for the action plan, the follow-up draft and the organizer insight
- A dashboard that updates live when an outcome is verified

Skip:

- Authentication (use the role switcher)
- Actually sending emails (show a copy button)
- Real third-party integrations

State honestly on the limits slide: a human confirms outcomes and sends the messages. The AI recommends and drafts; it does not act alone.

Risks and pitch line

Judges are likely to probe three weak points, and each has a ready answer.

Likely challenge	Your answer
Outcomes could be fake or inflated	Two-sided verification with an evidence field; only verified outcomes are counted
The AI could hallucinate deal details	The AI uses only data inside the opportunity, and the founder approves every output
"Isn't this just a CRM?"	Organizer-side outcome verification and ecosystem-level conversion analytics

Suggested pitch line:

> BridgeFlow turns ASEAN's startup connections into verified investments, partnerships and cross-border pilots, and tells founders exactly what to do next.

Next steps

Choose what to build first, and settle the technical choices that decide how fast it can be built.

- [ ] Decide: working BridgeFlow prototype first, or the pitch and demo script first
- [ ] Confirm the two hackathon categories and the judging criteria, so the pitch is framed for them
- [ ] Choose the stack: plain HTML/JS, React or Python
- [ ] Choose how Gemma 4 will run: Google AI Studio API, Ollama locally or Hugging Face
- [ ] Seed 15 to 25 realistic opportunities across 5 or more ASEAN countries
